Prompt 1:

All tasks completed!
5/5
Anda adalah seorang Senior Frontend Engineer yang berpengalaman membangun website modern menggunakan HTML, Tailwind CSS, dan Vanilla JavaScript. Tugas Anda adalah menghasilkan kode yang clean, modular, mudah dipahami, mengikuti best practice frontend, serta siap dijalankan.
Buatlah sebuah aplikasi bernama Test Case & Bug Tracking Manager menggunakan HTML, Tailwind CSS, dan Vanilla JavaScript (tanpa framework). Pisahkan kode ke dalam tiga file, yaitu: index.html, style.css dan script.js.
Gunakan sidebar di sebelah kiri sebagai navigasi, header di bagian atas, area konten utama di sebelah kanan, warna netral seperti putih, abu-abu, dan biru, card untuk menampilkan ringkasan data, Tabel untuk menampilkan daftar test case dan bug, badge berwarna untuk status dan prioritas, dan Modal untuk menambah, mengedit, melihat detail, dan menghapus data.
Semua menu harus berjalan dalam satu halaman tanpa berpindah halaman atau melakukan reload. Gunakan Vanilla JavaScript untuk mengganti konten yang ditampilkan sesuai menu yang dipilih. Semua form tambah dan edit harus menggunakan modal. Jangan membuat halaman baru untuk setiap fitur.
Plan application structure and features
Let me plan the full structure before writing code:
Pages/Views (SPA):
1. Dashboard — summary cards + recent activity
2. Test Cases — table with CRUD modal
3. Bug Tracker — table with CRUD modal
4. Reports — simple stats/charts view
Data Models:
• TestCase: id, title, module, status (Pass/Fail/Pending/Blocked), priority (High/Medium/Low), assignee, createdAt, description
• Bug: id, title, module, status (Open/In Progress/Resolved/Closed), priority (Critical/High/Medium/Low), assignee, relatedTestCase, createdAt, description
Create index.html with sidebar, header, and main content are...

Lakukan perbaikan pada menu pada sebelah kiri agar dapat di tutup sehingga konten pada sebelah kanan menjadi fullscreen. Lalu tambahkan fitur pemilihan dark and night mode tanpa melakukan perubahan html yang ada dengan penambahan javascript.
Selanjutnya berikan opsi setting pada profile untuk melakukan perubahan nama, email, dan password. Serta lakukan penambahan login page dan logout page tanpa merubah code html yang ada.
Recreate all 3 deleted files (index.html, style.css, script....
Recreate all 3 deleted files with all new enhancements
All 3 files were deleted externally. I'll rebuild them from scratch with all the new features integrated. Let me write all three files in parallel:
Edited 2 files : 33s
Now the main JavaScript — the largest and most complete file:
Wrote file script.js
Now let me verify everything is wired correctly — especially the new features:
Explored 3 searches : 4s
All references are clean. Let me do a final file-count check:
Ran wc -l index.html style.css script.js && echo "" && echo "=== …
Semua fitur baru telah selesai diimplementasikan. Berikut ringkasan lengkap setiap perubahan:
✅ Ringkasan Perubahan
1. 🔒 Login Page
Halaman login tampil sebagai overlay fullscreen saat belum terautentikasi
Credential demo: qa@company.com / password123
Validasi input + error message inline
Session tersimpan di localStorage — refresh tidak perlu login ulang

Lakukan perbaikan pada fitur ubah nama, perubahan nama tidak tersimpan sehingga saat melakukan logout nama akan kembali menjadi default QA Engineer.
Lakukan penambahan grafik pada dashboard untuk mempermudah pembacaan total case, passed, failed, open bugs yang dapat difilter berdasarkan rentang tanggal.
Grafik yang idgunakan dapat berupa pie chart.
Explored 4 files : 6s
I now have full context. I can see the root bug and know exactly what to build. Let me identify the two problems:
1. Name not persisting after logout: In handleLogin(), when creating currentUser, it uses currentUser?.name — but currentUser was already set to null by confirmLogout(). So after logout and re-login, the saved name is lost.
2. Dashboard charts needed: Full pie chart section with date range filter.
Fix: name/email not persisting after logout → re-login
Root cause of the bug: confirmLogout() sets currentUser = null, then handleLogin() reads currentUser?.name which is null. The fix is to load from localStorage first (a separate profile store), keeping profile data independent from the auth session.
Read file script.js (8, 14)
Applied diff to script.js
Now fix handleLogin to read profile from the separate store, fix confirmLogout to not wipe profile, fix saveProfileSettings to write to profile store, and fix updateProfileLabels to read from profile store:
Explored 3 files : 4s
Now I have full context. I'll apply all four fixes in one diff and then add the dashboard charts:
Applied diff to script.js
Bug fix done. Now let's update the dashboard with pie charts + date range filter:
3 files changed
Undo all
Show all

Add date range filter to Test Cases table (max = today)
15/18
Lakukan perbaikan pada grafik dashbaord saat data hanya 1 piechart tidak terlihat, lalu lakukan penambahan fitur pemilihan tanggal pada test case dan bug tracker, pemilihan tanggal tidak boleh melebihi hari berjalan.
Let me first read the relevant parts of the code before making changes.
Explored 5 files : 9s
I have full context now. Let me identify the three issues precisely:
1. Pie chart with 1 slice invisible — When all data has the same status (one slice = 100%), the SVG arc path from startAngle=-90 to endAngle=270 produces a degenerate path (start point equals end point, arc draws nothing). Fix: detect single-slice case and render a full circle instead.
2. Date picker on Test Cases — Add from/to date filter to the filter bar + wire tcFilter.
3. Date picker on Bug Tracker — Same as above for bugs.
4. max constraint = today on both — Apply max="${today()}" to all date inputs everywhere (forms + filters).
Fix: pie chart invisible when only 1 category has data (dege...
Now apply all four changes in one pass:
Applied diff to script.js
The single-slice inner circle fill must be white in light mode but dark-mode-aware. Let me fix that with a CSS class instead of hardcoded white, and also handle the dark mode for the inner circle. First, let me add a CSS variable approach in style.css:
Searched files in style.css for "donut-center-value"
Applied diff to style.css
Now update the single-slice path in buildPieChart to use the CSS class instead of fill="white":
Applied diff to script.js

Dashboard recent cards: add assignee info + description summary
18/21
Lakukan perbaikan pada recent test cases dan recents bugs pada dashboard dengan memberikan informasi siapa yang dilakukan assignment dan summary dari testcase atau recent bugs, lalu ganti assigne dari text menjadi dropdown dengan pilihan Ibnu, Nuril, atau Aleena.
Read file script.js (590, 680)
Now read the form templates and the assignee field references:
Explored 1 search, 2 files : 5s
I have all the context I need. Now I'll make all three changes in a single efficient pass:
1. Dashboard recent lists — add assignee avatar + description snippet
2. TC form assignee — text → dropdown (Ibnu / Nuril / Aleena)
3. Bug form assignee — same dropdown
4. Seed data — update existing Alice/Bob/Charlie → Ibnu/Nuril/Aleena
Dashboard recent cards: add assignee info + description summ...
Applied diff to script.js
Now add a ASSIGNEES constant and a helper function for the avatar, then update the dashboard recent lists and both form inputs in one diff:
Read file script.js (55, 75)
Applied diff to script.js
Tools awaiting approval:
Execute Command
wc -l script.js style.css index.html
